

ABSTRACT OF THE DISCLOSURE

The apparatus is a cross fader with dual optocouplers which communicate first and second audio signals. A manually controlled blade shutter travels along a linear path wherein at a first end of the path, a first edge of the blade shutter is inserted into the first optocoupler thereby attenuating or cutting the first audio signal. Likewise, at a second end of the path, a second edge of the blade shutter is inserted into the second optocoupler thereby attenuating or cutting the second audio signal.
